Project Title: Statewide Wildlife Management Inventory

Project No.: W-65-R-32

Job Title: Statewide Upland Game

Job No.: A-4

Inventory and Management

Period Covered: December 15, 1982 to April 30, 1984

Abstract: This report includes upland game inventory and harvest data relating to the 1983-84 hunting seasons. Results of annual inventory and harvest surveys and long-term trends of indices derived by each method are included. Data obtained in 1983 are compared to 1982 and long-term averages.

Objectives: To conduct annual inventories and determine the population trend and annual harvest of upland game.

Procedures: Annual inventory procedures for ring-necked pheasants included winter sex ratio counts and summer roadside counts. The winter sex ratio counts were conducted from December 15, 1982 through February 10, 1983, as snow cover conditions allowed. Indices derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 22-August 18 on permanently established routes. Indices derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young.

Mourning dove breeding population trend was determined via the annual call count survey. This survey is part of a nationwide survey administered by the U. S. Fish and Wildlife Service. Call counts are conducted over 15 permanent, 20-mile routes. One count was made on all but one route between May 20-30.

Random brood counts were conducted on chukar and Hungarian partridge, forest grouse (ruffed and blue), sage grouse, sharp-tailed grouse, wild turkey and quail from June 15-August 26. Indices derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours of effort.

Sage grouse strutting ground counts and sharp-tailed grouse dancing ground counts were conducted from March 15-May 15. Total cocks counted, average cocks per ground and percent change from 1982 for comparable grounds were determined on a county basis.

The Gambel's quail call count route in Washington County was discontinued in 1980. Long period waterhole counts were completed in July and August.

Cottontail rabbit roadside counts were conducted over pre-established routes between July 15 and August 5. Indices derived include rabbits per mile and young per 100 adults.

Harvest questionnaires were used to determine the harvest of upland game birds, cottontail rabbit and snowshoe hare, band-tailed pigeon and wild turkey. A 20 percent sample of eligible licensees from the previous year's (1982) resident small game license file and 1983 combination license file was selected for the game bird and rabbit and hare questionnaire. Separate questionnaires were mailed to all ptarmigan and wild turkey permittees. Indices derived include total hunters, hunter-days, total harvest and hunter success per day plus success for each season.

The upland game questionnaires were analyzed by the Division of Wildlife Resources information systems services subsection. Due to accumulated rounding errors associated with transferring data from the printout, some totals (columns and percentages) may not total exactly.

Beginning in 1978, the program was expanded to report total estimated hunter-days and harvest by species and county rather than just the percent of pressure and harvest. Wild turkey and band-tailed pigeon questionnaires were analyzed by the Game Management Section personnel.

Field bag checks of upland game hunters were made primarily at checking stations, with additional random field checks made during each hunting season. Indices derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species using wing samples collected at checking stations.

During 1983 a computerized pull apart mailer was again used to obtain harvest data. Data input and storage was entered on tape instead of cards. This method was initiated in 1981, and was found to be very satisfactory.

Recommendations: This project should be continued for the purpose of determining trends of upland game populations and harvest statistics in Utah.

INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population hunted.

This is the thirteenth edition of this annual Upland Game Report. It is an annual performance report of information compiled during inventory and harvest surveys conducted under Federal Aid Project W-65-R, Job A-4. Information contained herein was compiled by conservation officers, biologists, game managers and the upland game management staff of the Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game in Utah. A separate section is devoted to each species of upland game hunted in Utah. Data are presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1983, a total of 90,592 Utah sportsmen spent 575,964 days afield in pursuit of various upland game species. The harvest of upland game totaled 772,596 animals. The proportion of the total upland game hunters which pursued each species is shown in Appendix Table 3 and the percentage failing to bag at least one bird of each species in Appendix Table 4. The regulations for 1983 upland game hunting seasons are shown in Appendix Table 6.

A summary of harvest statistics by species follow.

Species	Hunters Afield	Total Harvest	Hunter Days	Bag per Hunter-day	Bag/Hunter For Season
Pheasant	77,847	220,074	265,731	0.83	2.83
Mourning dove	28,258	272,964	100,554	2.71	9.66
Chukar partridge	10,418	29,649	31,904	0.93	2.85
Sage grouse	9,201	14,949	18,482	0.81	1.63
Forest grouse	13,414	30,088	34,530	0.87	2.24
Quail	4,012	11,248	10,232	1.10	2.81
Hungarian partridge	2,889	6,512	6,998	0.93	2.25
Wild turkey					
spring	69	14	161	0.09	0.20
fall	49	15	112	0.13	0.31
Band-tailed pigeon	--	--	--	--	--
Sharp-tailed grouse	0	0	0	--	--
Ptarmigan	13	14	21	0.67	1.08
Cottontail	22,467	180,767	96,151	1.88	8.05
Snowshoe	3,544	6,302	11,088	0.57	1.78
TOTAL	--	772,596	575,964	--	--

Total hunters afield for all species of upland game = 90,592

Harvest statistics were obtained from a random sample of licensed hunters by their response to a hunter questionnaire.

A total of 24,867 upland game bird questionnaires, a 19.6 percent sample, were mailed. The combined upland game bird and rabbit-hare questionnaire was again used. A total of 1,437 (5.8%) questionnaires were undeliverable. There were 827 returns from persons who did not purchase a license during 1983.

Of the 23,430 questionnaires delivered, 9,497 (40.5%) usable upland game questionnaires were returned. Of those, 2,723 purchased a license but did not hunt upland game. By dividing the total of 127,008 eligible licensees by the usable returns (9,497), a projection factor of 13.373486 is derived.

The 1983 hunter questionnaire sample size was increased to improve the precision of harvest estimates in counties where hunting pressure and harvest are limited. Extremely small samples from these counties tend to over-estimate the harvest and thus bias the results. Although harvest, number of hunters and days-afield may be over-estimated where small samples are obtained, harvest per hunter-day should be relatively precise.

The upland game questionnaire is designed to monitor statewide harvest trend from year to year. The more extensively a species is hunted, the more accurately the questionnaire measures the trend data. In an effort to improve the accuracy of indices for species which receive very little hunting pressure and harvest, and which have low densities and limited distribution, a unique questionnaire for that species is mailed to the permit holder. This method has been used for wild turkey, band-tailed pigeon, sharp-tailed grouse and white-tailed ptarmigan.

The annual harvest report is sometimes criticized for being inaccurate and without value. However, report users must recognize that the accuracy of the questionnaire is based on some basic assumptions. These assumptions are: (1) the returned useable sample is completely random (2) respondents recorded data correctly, i.e., they clearly understood the questionnaire, (3) respondents recorded data accurately, did not guess and were truthful, and (4) respondents correctly identified species hunted. If these assumptions are not met, projections of harvest by county may be over-estimated due to nonrespondent or memory biases. Extreme caution should be used in the interpretation of estimated harvest and hunters for specific species in specific counties. Rather, the long term trend in these indices should be used in managing the populations.

Presently, the upland game annual report contains the best data available and therefore constitutes the basic facts of upland game management. Although this report has its limitations, the trend data is valuable in making professional judgements regarding upland game populations and harvest.

The annual report is used in wildlife planning. It can be used to establish relative importance among species and for developing new resources through transplants or habitat developments. It points out areas of needed research by indicating problems and possible causes. It documents population trends and it combines all this inventory information into one easily accessible publication. Thus it is used extensively by federal land management agencies in environmental impact statements and management plans. It will become increasingly more important in developing management plans, and assessing impacts on wildlife habitat.

Average temperatures in 1983 were above normal from January through March. Temperatures during April, May, June and July dropped 4.3, 2.9, 1.3 and 1.6 degrees, respectively, below normal. August through November temperatures again increased to above normal.

The average precipitation in 1983 was 0.72 inches above normal for all months except January and July. January precipitation was 0.10 inches below normal.

April, May, June and July were slightly more wet than normal, while March had 1.39 inches above normal precipitation. Temperatures were below normal.

The effects this variable weather pattern had on brood success is only speculative, but successful nesting may have been delayed.

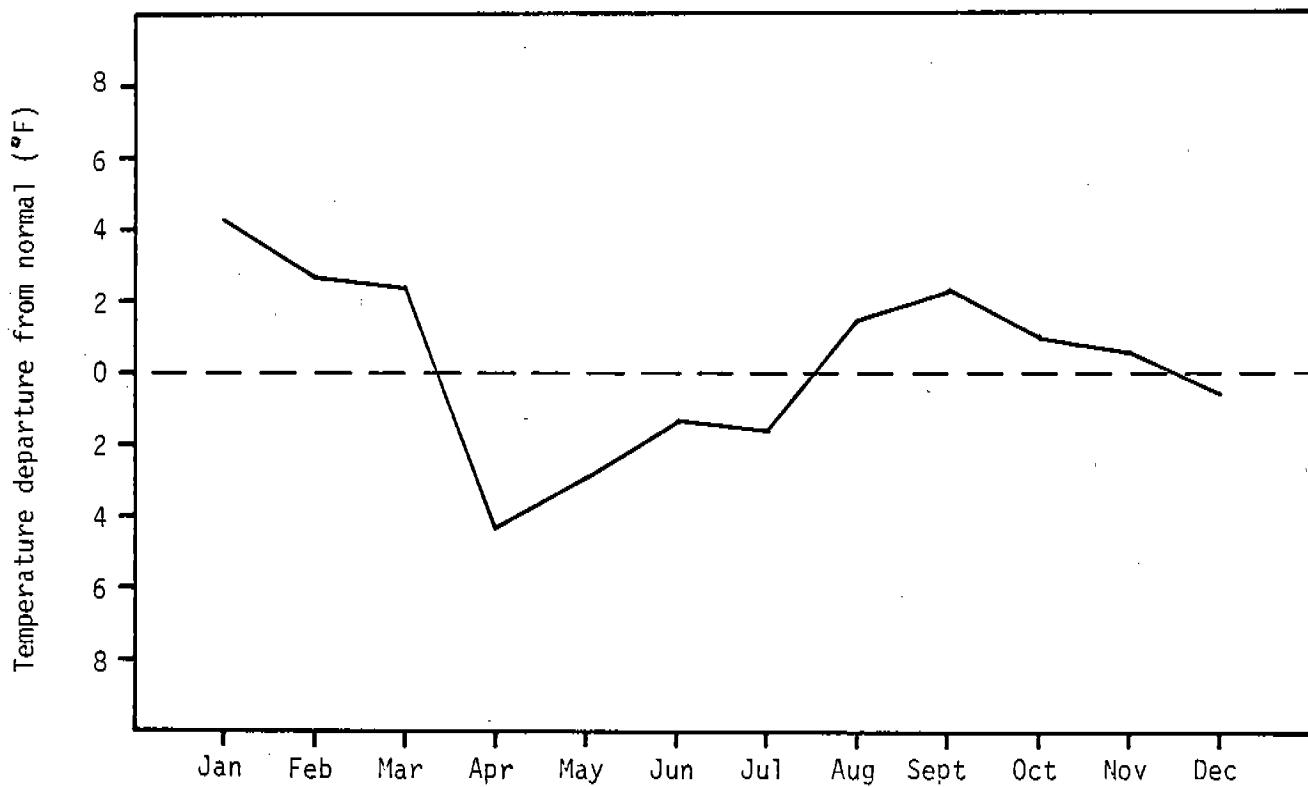

Figure 1. Monthly average temperature departure from normal, 1983.

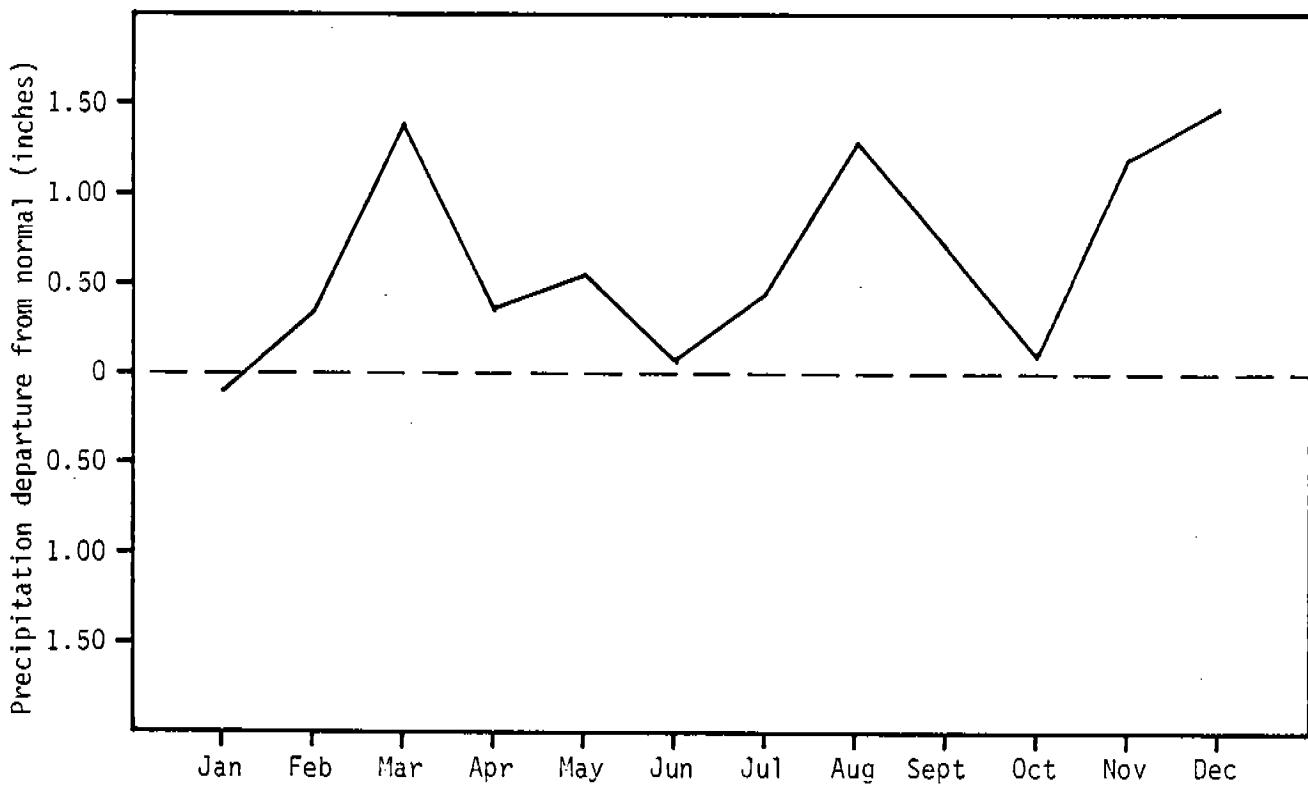

Figure 2. Monthly average precipitation departure from normal, 1983.

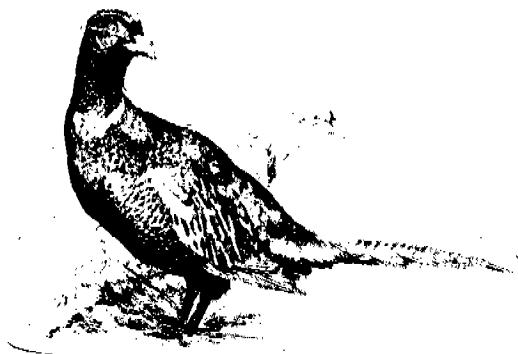

RING-NECKED PHEASANT

SUMMARY

The statewide breeding population indices, based on 1982 harvest data, were less than 1982 and below average. However, winter sex ratio indices indicated average breeding populations. Winter carry-over from 1982 was good in northern and central Utah.

Weather conditions during the nesting season were not as good as in 1982. Statewide monthly average temperatures were lower. Plant phenology was delayed and accumulated precipitation was 124 percent of normal. Production was generally below 1982 levels and below average statewide.

Harvest statistics compiled from the questionnaire indicated good success compared to 1982. Hunter pressure decreased 5 percent but total harvest increased 6 percent. Birds per hunter-day increased 12 percent from 1982. Field bag check data also showed that hunter success improved during 1983. The ratio of birds per hunter from field bag checks was comparable to the index from hunter questionnaires.

Winter Sex Ratio Counts

Results of the survey for the winter of 1982-83 and long-term trends are shown in Tables 1 and 2 of this section. Statewide comparisons to the winter of 1981-82 and the 10-year average are as follows:

	<u>Winter of 1982-83</u>	<u>Percent change from 1981-82</u>	<u>Average</u>
Total pheasants counted (roadside)	7,107	-39	-15
Hens per cock	5.5	+20	+38
Pheasants observed per 100 hours	1,900	-33	+41
Total hours effort (roadside)	374	-6	-44

Winter sex ratio counts indicated a decreased breeding population in 1983, but remained above average. The hen-cock ratio increased 20 percent from 1982 and was well above average. Counting conditions were generally good, but limited snow cover during January, mileage restrictions and decreased effort in the Northern and Southeastern regions, reduced pheasant observations.

Roadside Counts

A summary of summer roadside pheasant counts for 1983 is shown in Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in Tables 4-8. Summer 1983 survey results compared to 1982 and the previous 10-year average follow:

	<u>1983</u>	<u>Percent change from 1982</u>	<u>Average</u>
Total pheasants observed	2,378	-22	-10
Total miles driven	2,238	-9	-19
Pheasants per mile	1.06	-11	+10
Average brood size	5.03	-2	-5
Young per hen	3.85	-1	+2
Percent of hens with young	74	-1	+3

April, May, June and July temperatures averaged 2.5 degrees below normal with an average of 0.37 inches above normal precipitation.

The late spring, with cold and wet conditions in April, May, June and July, apparently delayed or reduced nesting success. Counting conditions were good over most of the state.

Pheasant production appears to have decreased from 1982 in all regions except the Northeastern. Production declines were noticeable in the Northern Region. The density index (pheasants per mile) decreased from 1.19 in 1982 to 1.06 in 1983 which is below the 21 year average (1.25).

Below average production, and a lower carry-over from 1982, coupled with spotty inclement brood weather during the early summer months of 1983, resulted in lower fall pheasant populations.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire for 1983 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12 and total statewide harvest statistics in Table 13. A comparison of 1983 harvest statistics to 1982 and the 35-year average follow:

		Percent change from	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Pheasant hunters	77,847	-9	-7
Pheasants harvested	220,074	+6	-6
Hunter-days afield	265,731	-5	+20
Pheasants per hunter-day	0.83	+12	-22
Pheasants per hunter	2.83	+16	+1

Total hunters decreased from 1982 and was below the long-term average (1948-82). Hunter-days afield decreased but the total harvest increased 5 percent from 1982. Hunter success (pheasants per hunter-day) increased from 1982 but remained well below average. Pheasants per hunter also increased 16 percent to slightly above the 35-year average.

Long-term trends (1968-83) of total hunters, hunter-days, harvest and hunter success are shown in Figure 1. Generally, the trend continues toward more hunter-days with gradual declines in total pheasants harvested and hunter success.

Field Bag Checks

A summary of pheasant field bag check data for 1983 is shown in Table 14. The hunter success trend determined via bag checks since 1978 is found in Table 15. A comparison of 1983 data, on a statewide basis, to 1982 and the 10-year average follow:

		Percent change from	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Total hunters checked	4,532	+8	-13
Total hours hunted	15,609	+7	-9
Pheasants per hunter (complete hunts)	0.85	+20	+12
Pheasants bagged per 100 hours	20	+18	+18
Average hours per hunter-day (complete hunts)	4.3	0	0
Hours hunted per pheasant bagged	5.1	-9	-14

Checking Station Report

Weather was generally good over the state Saturday and Sunday (November 5-6, 1983). Scattered showers occurred over northern Utah between 9:00 and 10:00 a.m., but temperatures were in the high 60's and low 70's on Saturday.

Generally, hunting pressure was down substantially over the state. This is attributed to less land being accessible to hunters, particularly in Weber, Davis, Salt Lake, Utah and Millard counties.

Hunter success was up from 1982 in Box Elder, Cache, Weber and Uintah counties as predicted. Hunter success was about the same as last year in Juab and Sanpete counties. Southern Sanpete County was better around Gunnison than around Ephraim. Hunter success was better than predicted in Duchesne, Utah and Millard counties. Hunter success was worse than predicted in Carbon, Emery and Sevier counties. Hunting success was down in Salt Lake and Davis counties.

MIGRATORY UPLAND GAME BIRDS

SUMMARY

Mourning Doves

The breeding density index increased slightly in 1983 but remained well below average.

Harvest statistics derived from the questionnaire showed decreased hunter pressure and harvest compared to 1982. However, hunter success increased 3 percent.

Field bag checks also indicated a significant increase in hunter success supporting the results of the questionnaire survey.

Division personnel collected 2,877 wings for aging during 1983. Aging of wings indicated juvenile per 100 adult ratio increased to 106 compared to 91 in 1982, and the 17-year average of 117. More of the juvenile birds harvested were hatched earlier than in 1982, and the long-term average.

Band-tailed Pigeons

No band-tailed pigeons were banded in Utah in 1983. Banding of band-tailed pigeons was discontinued in 1979, as a result of recommendations by the Four-Corners Band-tailed Pigeon Study Committee.

Hunter participation and harvest during the 1983 season is unknown because data is unavailable.

MOURNING DOVE

Call Count Survey

Results of the 1983 call count survey are found in Table 1 of this section. The long-term trend of the state's breeding density index (average doves heard per route) is shown in Table 2. Indices shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the Fish and Wildlife Service; however, indicated trends are similar (Figure 1). The following is a comparison of the results of the 1983 survey to 1982 and the average for the period 1964-1982:

		Percent change from	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Average doves heard per route	9.9	+1	-28
Average calls heard per route	43.2	+3	-26
Average doves seen per route	9.5	+44	-33

Coo count data indicated increased breeding activity in late May compared to 1982 but continued to be well below the long-term average.

Harvest

Hunter Questionnaire

Information obtained from the hunter questionnaire for 1983 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7. The following is a comparison of the harvest statistics for 1983 compared to 1982 and the 10-year (1973-82) average:

		Percent change from	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Mourning dove hunters	28,258	-11	-12
Mourning dove harvest	272,979	-3	-17
Hunter-days afield	100,568	-7	-8
Mourning doves per hunter-day	2.71	+3	-10
Mourning doves hunter	9.66	+7	-5

Although hunter success increased three percent, total harvest decreased slightly compared to 1982. Numbers of dove hunters, hunter-days afield and doves per hunter-day remained below the 10 year average.

Long-term harvest trends are depicted in Figure 2.

Field Bag Checks

A summary of field bag check data for 1983 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1983 survey compared to 1982 and the average (1967-82) follow:

	<u>1983</u>	Percent change from	
		<u>1982</u>	<u>Average</u>
Total hunters checked	1,181	-30	-37
Total hours hunted	4,656	-25	-28
Doves per hunter (complete hunts)	5.76	+45	+64
Doves bagged per 100 hours	108	+30	+17
Average hours per hunter-day (complete hunts)	4.9	+53	+32
Hours hunted per dove bagged	0.9	+6	-18

Field bag checks indicated a significant increase in hunter success. This confirms the questionnaire results which also indicated improved hunter success. The total number of hunters checked was down 30 percent from 1982. Dove hunters spent more time afield per hunter-day than in 1982, and more time was spent per dove bagged, according to field bag check data.

Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1974 through 1983 is contained in Table 10. Hatching dates for immature doves harvested in the Northern Region since 1974 are shown in Table 11. Hatching dates for immature doves harvested in Utah in 1983 are shown in Table 12.

Following is a comparison of data collected in 1983 to 1982 and long-term averages (1966-82):

	<u>1983</u>	Percent change from	
		<u>1982</u>	<u>Average</u>
Sample size	2,877	-8	-13
Immatures/100 adults	106	+16	-9
Percent of immatures hatched on: (N. Region)			
August 3 or later	22.8	-30	-42
July 25 or later	65.1	-18	-19
Before July 25	34.7	+67	+80

Fewer wings were collected for aging during the 1983 season compared to 1982. However, the 106 immatures per 100 adults ratio indicated a more successful hatch than 1982, but remained below average. Wing analysis indicated significantly earlier hatching for 1983 compared with 1982 and the long-term average.

BAND-TAILED PIGEON

Banding

Between 1969 and 1978, 2,649 total pigeons were banded in Utah and 975 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded, using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the state's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent, well within the harvestable surplus.

Harvest

Results of the 1983 band-tailed pigeon harvest are unknown, because permits were not required. Therefore, a questionnaire could not be sent to participants. Harvest trends since 1970 are shown in Table 14.

		Percent change from

Band-tailed pigeon harvest	--	--	--
Hunter-days afield	--	--	--
Pigeons per hunter-day	--	--	--
Pigeons per hunter	--	--	--

Total hunters, hunter-days afield and total harvest are unknown for 1983. It is assumed that a majority of the 1983 harvest again occurred in Iron and Washington counties.

CHUKAR PARTRIDGE

SUMMARY

The statewide breeding population of chukars decreased in 1983 following the low production rate of 1982. Overwinter survival appeared less than normal. Late winter and early spring precipitation, critical to successful chukar production, was above average, indicating good reproductive potential.

Results of the brood survey indicated that brood production was above average. Favorable nesting conditions and adequate forage were available as a result of the above normal temperatures and above average precipitation during January, February and March. However, April, May, June and July were colder than normal with above normal precipitation which may have reduced brood survival. The indicated chukar density decreased significantly during 1983, although, chukars observed per 100 hours of effort remained about average.

Harvest statistics reflected a significant increase in harvest. Likewise, hunter success (chukars per hunter-day) increased 24 percent from 1982. Chukar hunters decreased 8 percent and spent 2 percent less time afield than in 1982.

Brood Counts

Results of the annual random brood survey for 1983 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and chukars observed per 100 hours are found in Tables 2-4. Following are the survey results for 1983 compared to 1982 and the 10-year (1973-82) average:

		Percent change from 1982		Average
	1983	1982		
Total chukars observed	336	-60	-60	
Young per 100 adults	586	+325	+76	
Mean brood size	8.00	-10	-7	
Chukars observed per 100 hours	398	-20	+4	
Total hours effort	84.5	-50	-66	

Harvest data for 1982 indicated decreased breeding populations for 1983 in all regions except the Northeastern. Late winter and early spring precipitation (December-April) was above average over the entire state (Figure 2) producing favorable conditions for good production. Above average temperatures were recorded through March; but April, May, June and July were cooler than normal. Above normal precipitation continued through April, May, June and July.

Effort on chukar brood counts decreased significantly from 1982 and remained far below average.

Brood count sample sizes were again extremely small for all regions due to reduced effort. The Northern Region counted 3 and the Southeastern Region counted 4 of the state total of 8 broods. Chukar density was 4 percent above the 10-year average and production was up considerably from 1982.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire survey for 1983 are shown in Table 5. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. Following is a comparison of 1983 harvest statistics to 1982 and the 25-year average:

		Percent change from 1982		Average
	1983	1982		
Chukar hunters	10,418	-8	-32	
Chukars harvested	29,649	+21	-32	
Hunter-days afield	31,904	-2	-29	
Chukars per hunter-day	0.93	+24	-2	
Chukars per hunter	2.85	+32	+3	

Chukar hunters spent less time afield but harvested about 21 percent more birds than in 1982. Chukars per hunter-day was above the 1982 level but slightly below the statewide average. The Central Region again had the highest percentage of the harvest in 1983, and also had the highest percentage of hunter pressure.

Field Bag Check

A summary of field bag check data for 1983 is shown in Table 10. The hunter success trend determined by field bag checks since 1978 is shown in Table 11. Data for the 1983 season compared to 1982 and the (1966-82) average follow:

	<u>1983</u>	<u>Percent change from</u>	
		<u>1982</u>	<u>Average</u>
Total hunters checked	242	-37	-55
Total hours hunted	889	-45	-63
Chukars per hunter (complete hunts)	0.98	+1.45	-11
Chukars bagged per 100 hours	26	+189	+8
Average hours per hunter-day (complete hunts)	4.4	-4	-2
Hours hunted per chukar bagged (complete hunts)	4.5	-61	-10

Field bag checks indicate hunter success was up, although fewer hunters pursued chukars in 1983 and spent fewer days afield. The hours required to bag a chukar was 10 percent less than average.

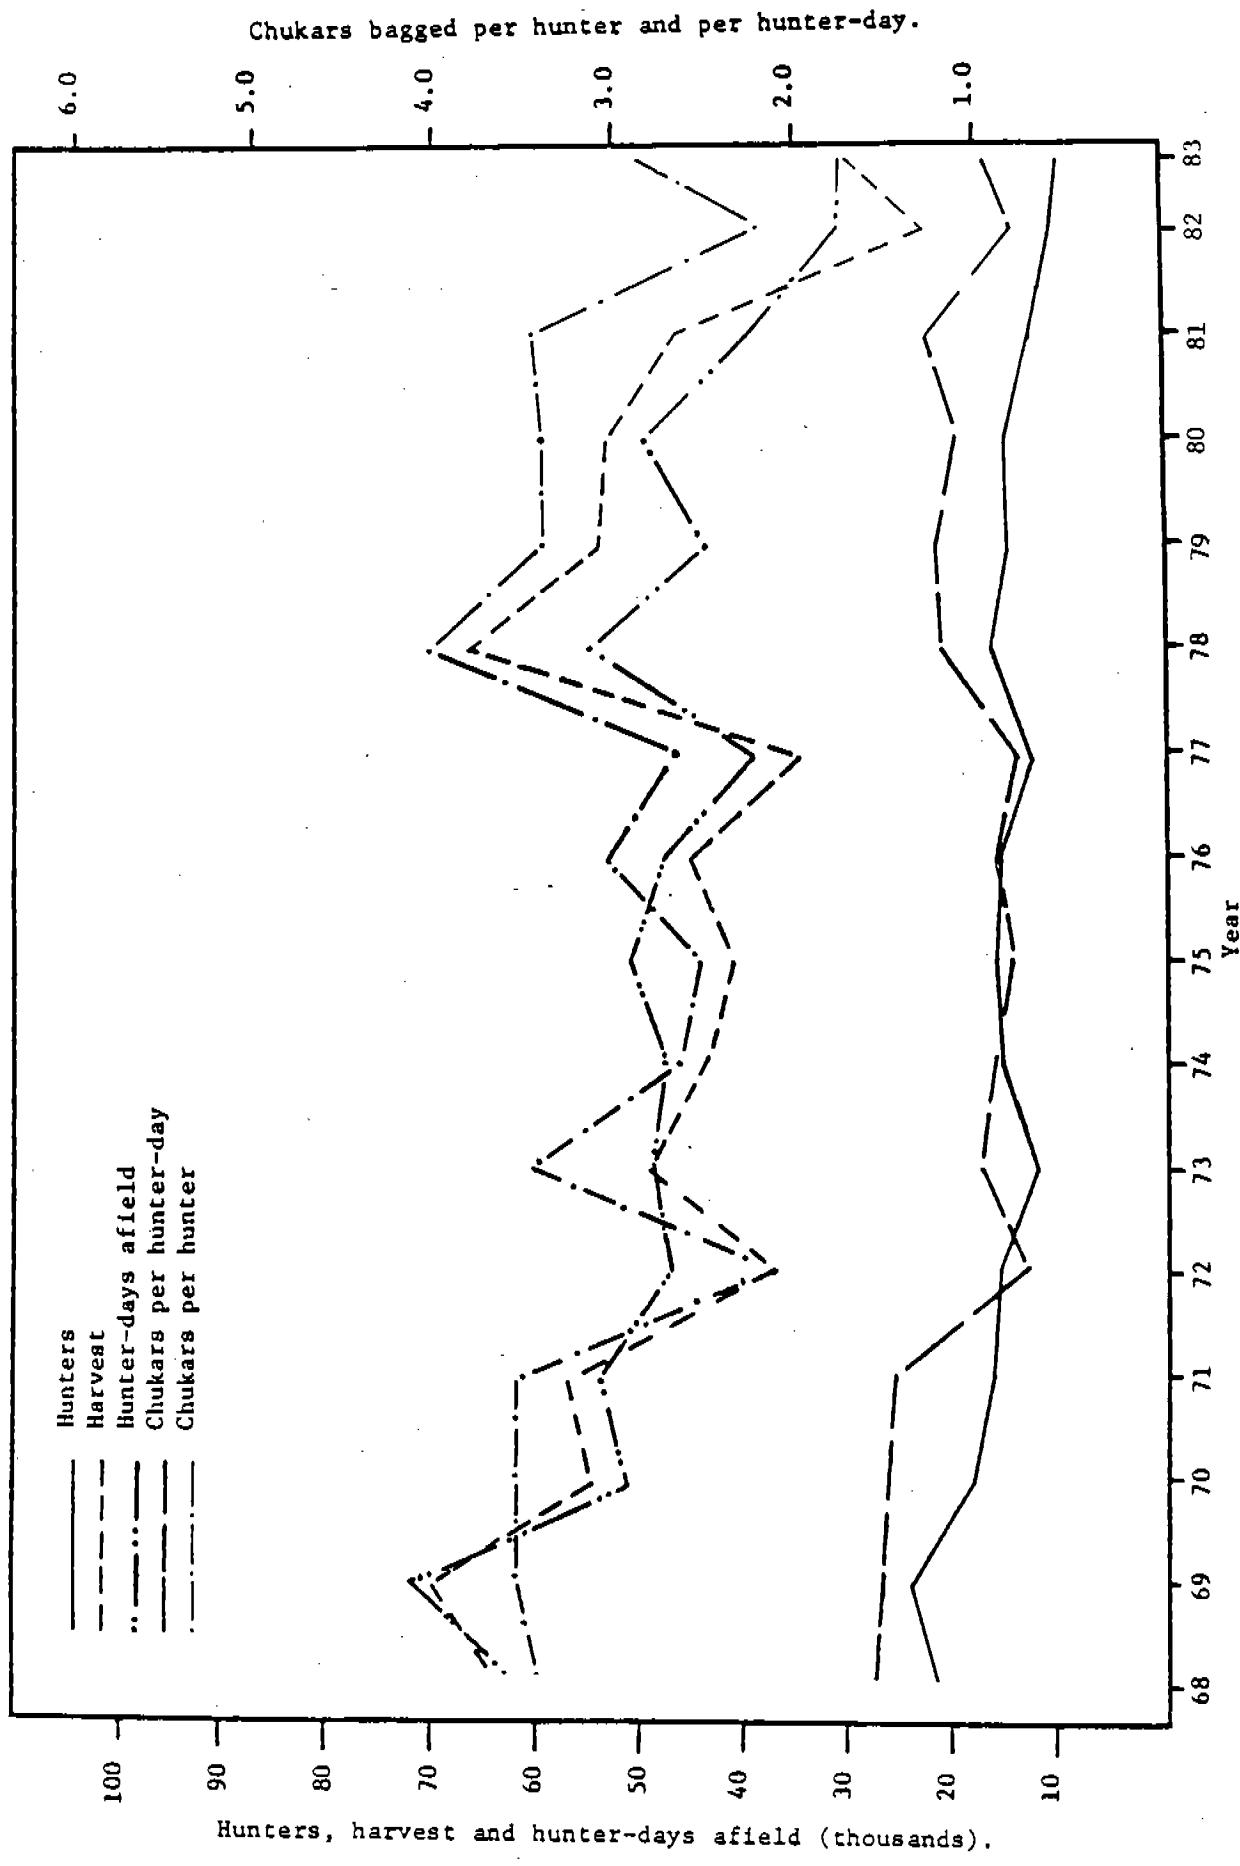

Figure 1. Statewide trends of chukar partridge harvest statistics.

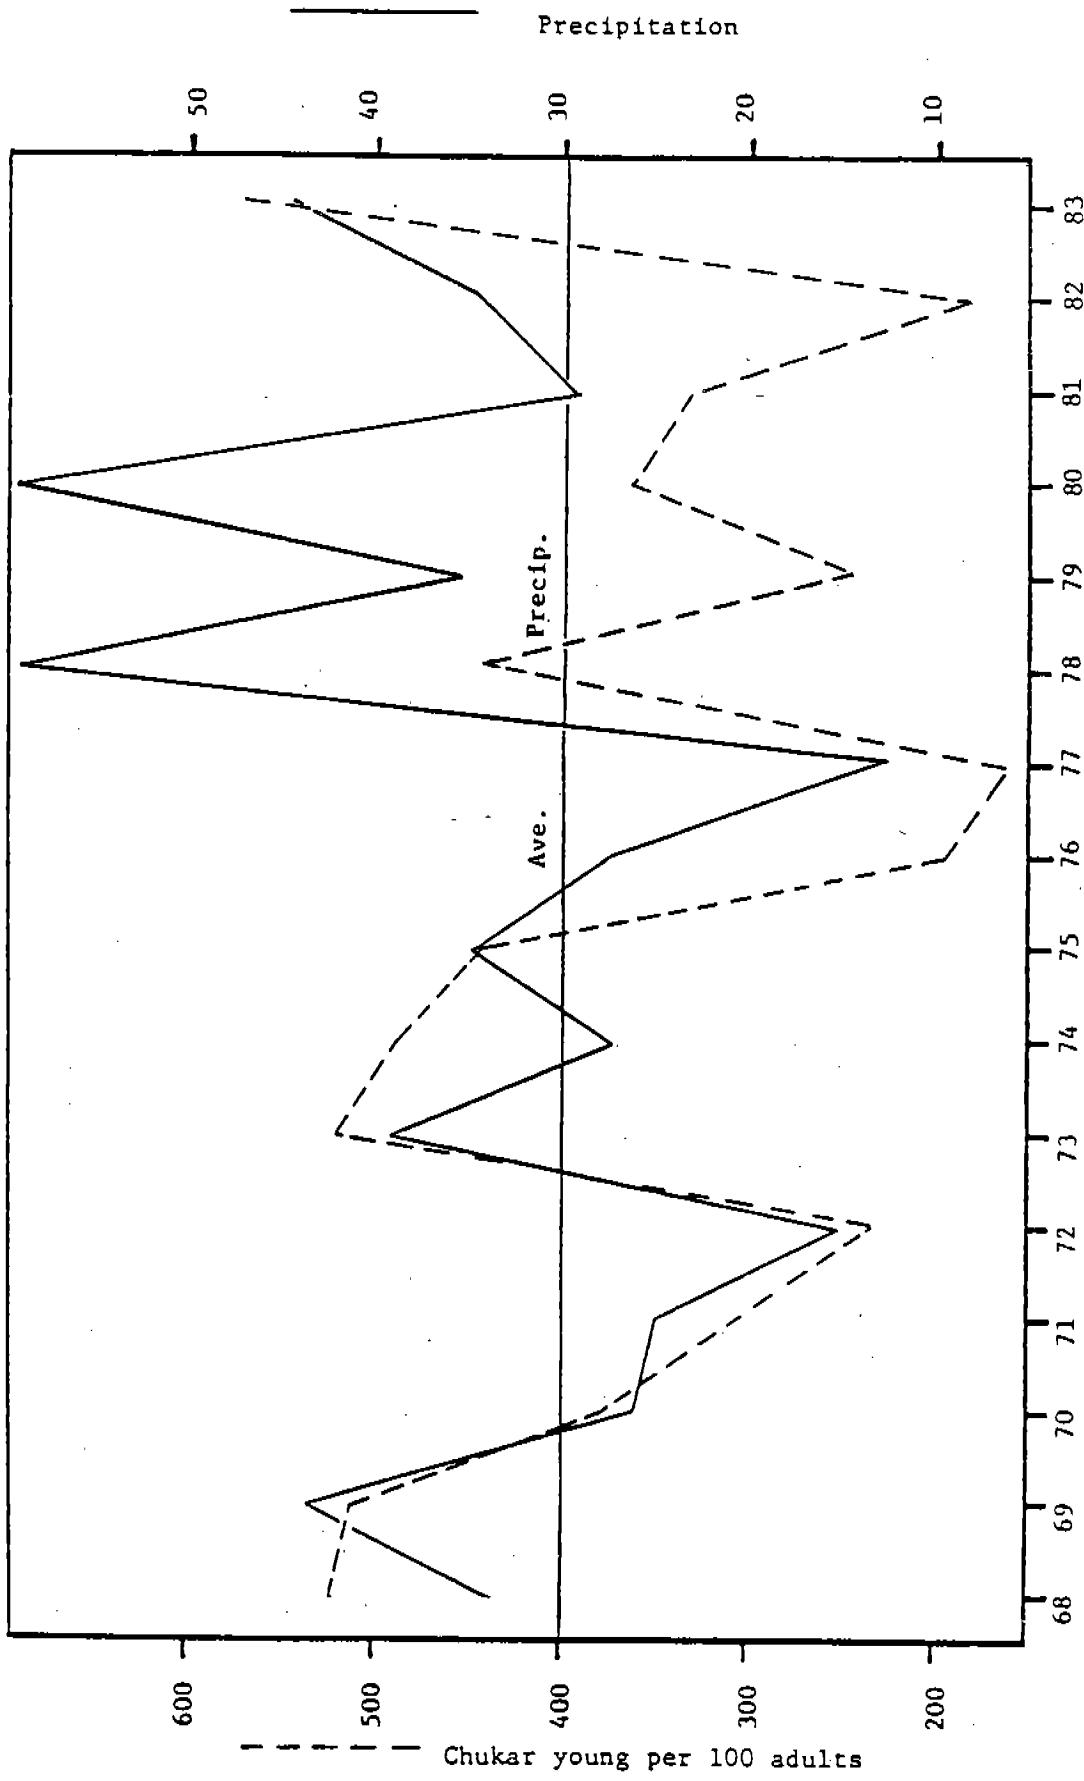

Figure 2. Relationship between late winter and early spring (Jan.-April) precipitation and chukar production.

SAGE GROUSE

SUMMARY

Harvest data for 1982 indicated a below average breeding population of sage grouse for 1983. Strutting ground surveys also indicated a 12 percent drop in male attendance from 1982.

Brood surveys showed increased production throughout the state except the Southern region during 1983. However, birds observed per 100 hours decreased 36 percent compared to 1982, and was significantly below average.

The higher production in 1983 was apparent in harvest statistics collected from questionnaires and from field bag checks. Total statewide harvest increased 20 percent and was 2 percent below the 20-year average. Total hunters and hunter-days afield both increased 2 and 18 percent, respectively, from 1982. Sage grouse bagged per hunter and sage grouse bagged per hunter-day both increased from the previous year.

Strutting Ground Counts

The status of the sage grouse breeding population for 1983, as indicated by strutting ground counts, is shown in Table 1 of this section. Results of this survey for 1983 compared to 1982 and the 1967-82 average follow:

	<u>1983</u>	<u>Percent change from 1982</u>	<u>Average</u>
Number of grounds counted	113	-7	+3
Total male grouse counted	1,711	-18	-23
Average male grouse per ground	15	-12	-25
Percent change from previous year (comparable grounds)	-8	--	--

Access for spring 1983 strutting ground counts was generally good in all regions of the state. Although the central and southeastern regions showed an increase in sage grouse counted, the numbers of grouse observed were down in all other regions. The statewide index for comparable grounds was down 8 percent. Harvest data for 1982 indicated below average populations going into the winter of 1982-83, but the numbers of juvenile birds indicated poor production during 1983. Declines in breeding populations appeared to be the trend in most areas of the state.

Brood Counts

Results of the survey for 1983 are found in Table 2. Long-term trends of young-adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5. Indices for 1983 are compared to 1982 and the previous 10-year (1973-82) average as follows:

	<u>1983</u>	<u>Percent change from 1982</u>	<u>Average</u>
Total sage grouse counted	1,312	-29	-57
Young per 100 adults	202	+13	+29
Mean brood size	4.58	-6	+1
Sage grouse observed per 100 hours	258	-36	-35
Total hours effort	508	+10	-36

The effort devoted to sage grouse brood counts was 36 percent below average, and the total number of grouse counted was 57 percent below average.

Sage grouse density decreased 36 percent from 1982, but production showed a 13 percent increase. Fewer adults and fewer young were observed, with average brood size 1 percent above the 10-year average.

Harvest

Hunter Questionnaire

Results of the 1983 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The results of the 1983 hunting season compared to 1982 and the 1963-82 average follow:

	<u>1983</u>	Percent change from <u>1982</u> <u>Average</u>	
Sage grouse hunters	9,201	+2	-17
Sage grouse harvested	14,949	+20	-2
Hunter-days afield	18,467	+18	+3
Sage grouse per hunter-day	0.81	+3	-5
Sage grouse per hunter	1.63	+18	+16

Production increased slightly in 1983 and was reflected in the harvest. Total statewide harvest increased 20 percent. Total sage grouse hunters and hunter-days afield also increased. Hunter success increased 4 percent in the Northern Region where 32 percent of the harvest and 44 percent of the hunting pressure occurred.

Long-term sage grouse harvest trends are shown in Figure 1.

Field Bag Checks

A summary of field bag check data for 1983 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12. Results of the 1983 survey compared to 1982 and the 1973-82 average follow:

	<u>1983</u>	Percent change from <u>1982</u> <u>Average</u>	
Total hunters checked	1,132	-20	-47
Total hours hunted	5,615	-21	-32
Sage grouse per hunter (complete hunts)	0.99	+34	+20
Sage grouse bagged per 100 hours	19	+36	0
Average hours per hunter-day (complete hunts)	5.5	+4	+31
Hours hunted per grouse bagged	5.6	-21	+4

Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1983 is found in Table 13 and the trend from 1980-83 in Table 14.

Following are data derived from wing surveys in 1983 compared to 1982 and the 1978-82 averages:

		Percent change from	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Sample size	1,000	-16	-37
Percent males	43	+10	+5
Percent females	57	-7	-3
Young per 100 adults	152	+22	+19
Young per 100 hens (adult)	228	+27	+16

Analysis of wings collected at checking stations during the 1983 season indicates that statewide production was up compared to 1982, and above the previous 5-year average. However, production remained down for the northern portion of the state and specifically Box Elder County.

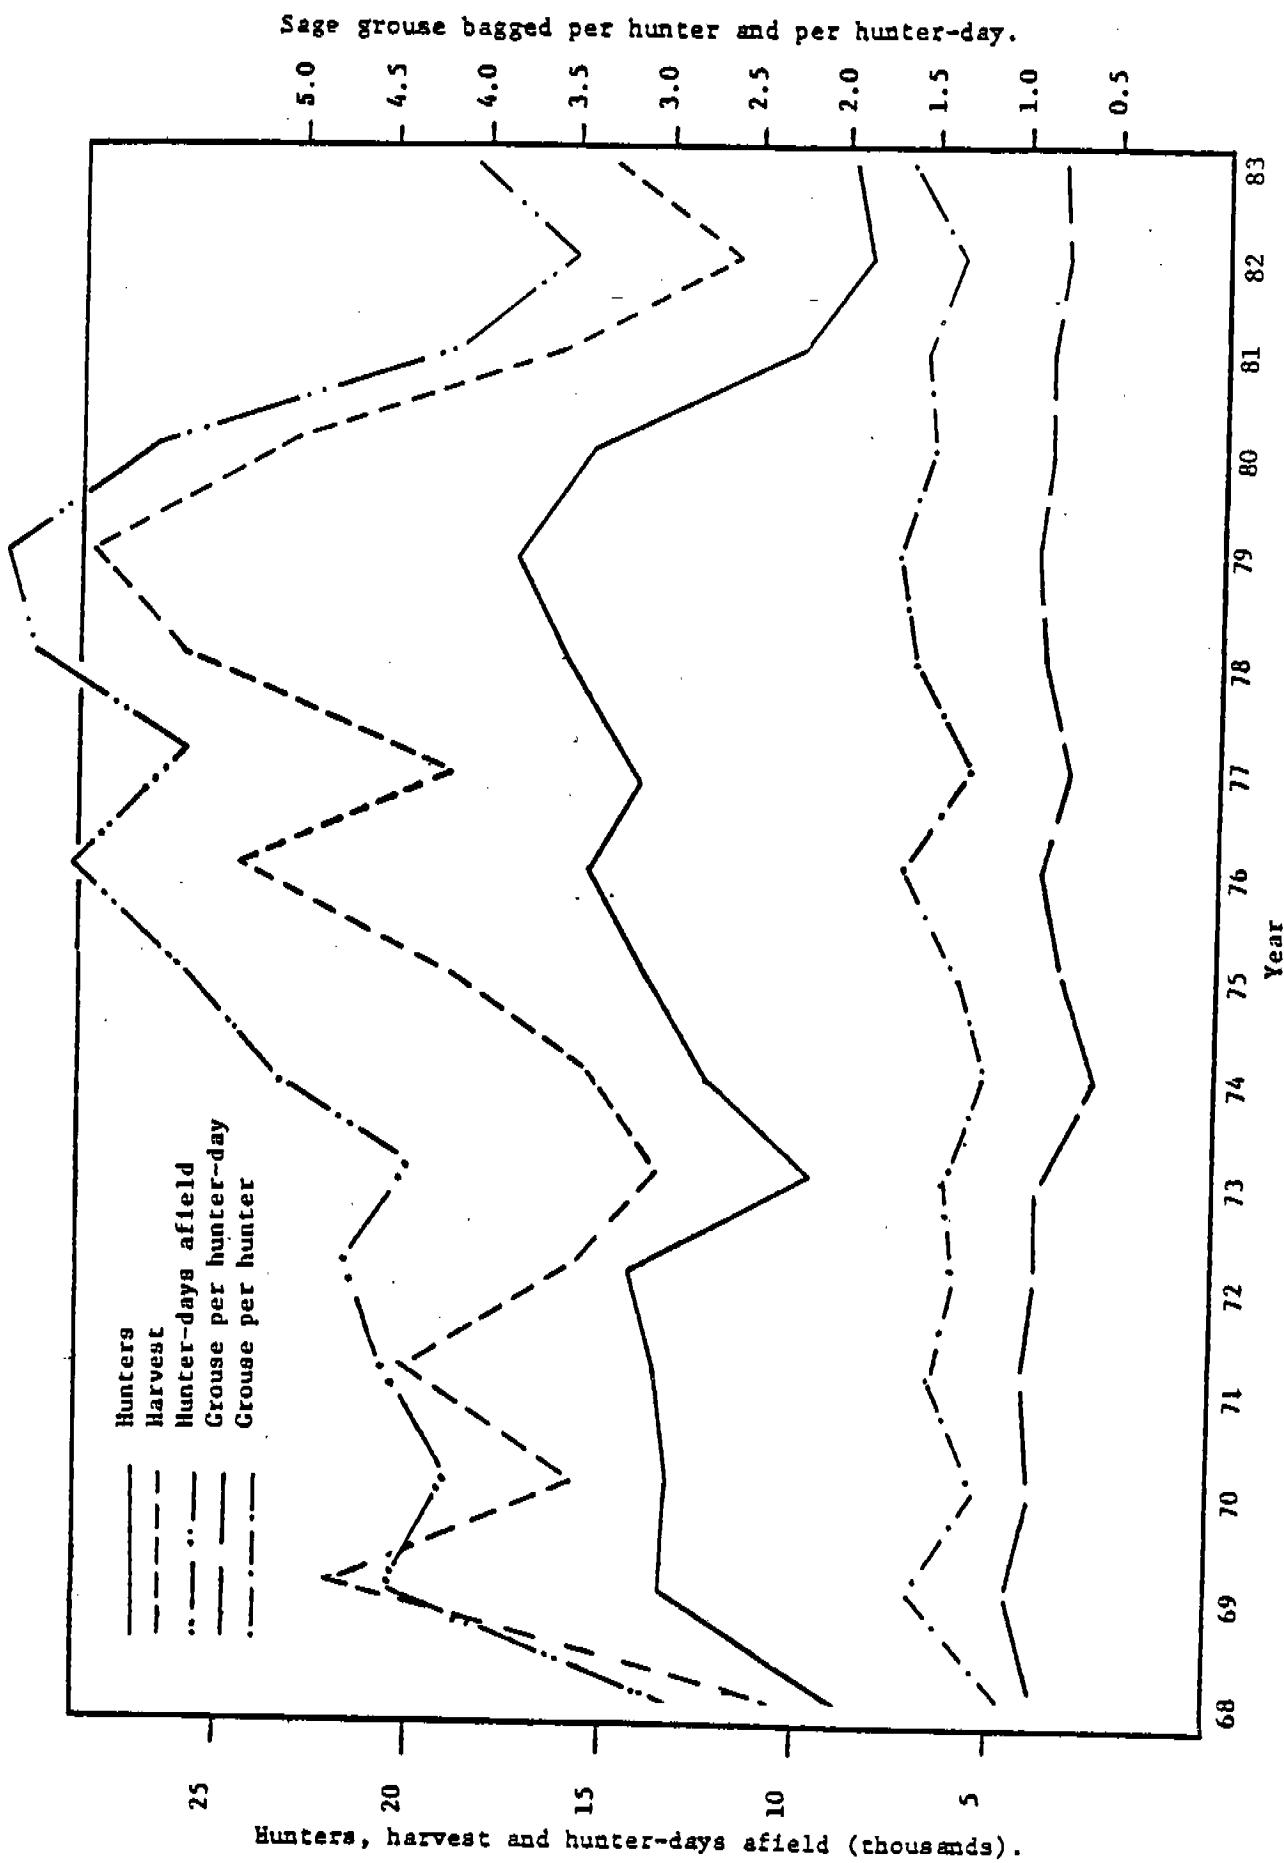

Figure 1. Statewide trend of sage grouse harvest statistics.

FOREST GROUSE

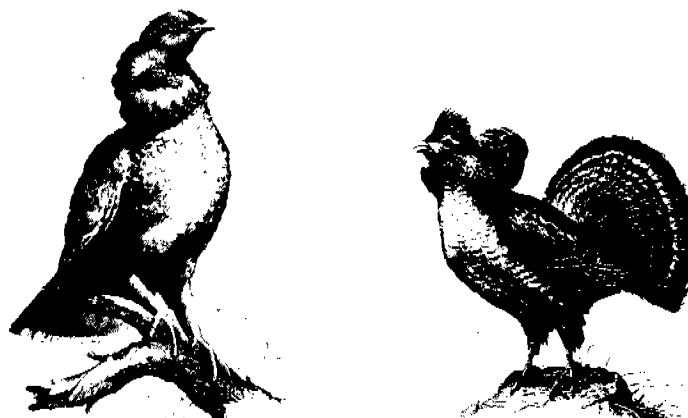

SUMMARY

Judging from harvest statistics for the fall of 1982, the 1983 breeding populations of both ruffed and blue grouse were lower than in 1982, making the fourth consecutive year of declining breeding populations. Production of ruffed grouse indicated by brood counts was down from 1982 but remained above average. The number of ruffed grouse observed during brood surveys and the apparent density (grouse per 100 hours) suggested a significant decrease in abundance in 1983 compared to 1982. However, harvest data contradicted this conclusion.

Production of blue grouse was down slightly from 1982 but exceeded the 10-year average. Blue grouse observed per 100 hours of effort remained 8 percent above average. A total of 69 forest grouse broods were observed during 1983 compared with 116 in 1982 and 132 in 1981.

Harvest statistics indicated higher density of forest grouse. Total harvest increased from 21,778 during 1982 to 30,088 in 1983, a 38 percent increase. Total hunters also increased from 12,384 in 1982 to 13,414 in 1983, and days afield increased from 28,767 to 34,530.

Field bag check data confirmed the increased success shown by the questionnaire. Limited blue grouse wing data, however, indicated an increase in both young per 100 adults and young per 100 hens, in the Central and Northeastern regions.

Brood Counts

Ruffed Grouse

Results of the annual random brood survey for 1983 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1983 compared to 1982 and the previous 10-year average follow:

		Percent change from	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Total ruffed grouse observed	86	-62	-59
Young per 100 adults	353	-13	+14
Mean brood size	5.15	0	+15
Ruffed grouse observed per 100 hours	19	-44	-34
Total hours effort	504	-28	-45

Harvest statistics for 1982 indicated a below average breeding population for 1983.

Effort on brood surveys decreased significantly in comparison to 1982 and was 45 percent below average.

Total ruffed grouse observed decreased from 1982 to 59 percent below average. Grouse observed per 100 hours was 44 percent less than 1982.

Mean brood size, based on a sample of 13 broods (compared to 22 broods observed in 1982), remained slightly above the long-term average.

Blue Grouse

Results of the annual random brood survey for 1983 are shown in Table 5 of this section. Long-term trends of young-adult ratios, mean brood size and blue grouse observed per 100 hours are found in Tables 6-8. Survey results for 1983 compared to 1982 and the 10-year average follow:

		Percent change from	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Total blue grouse observed	417	-34	-34
Young per 100 adults	272	-8	+12
Mean brood size	4.29	+6	+1
Blue grouse observed per 100 hours	83	-9	+8
Total hours effort (forest grouse)	504	-28	-45

Harvest statistics for 1982 indicated the blue grouse breeding population for 1983 was below average.

All indications from the 1983 summer surveys on blue grouse were that production was slightly below 1982, but 12 percent above the average.

Total observations declined 34 percent, probably a result of decreased effort. The number of grouse observed per 100 hours of effort decreased from 1982 but was 8 percent above average.

Wing samples collected at checking stations were limited, but indicated slightly increased production in the Central and Northeastern regions.

Harvest

Hunter Questionnaire

Results of the 1983 forest grouse (ruffed and blue grouse combined) hunter questionnaire are shown in Table 10. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 11-13 and total statewide harvest statistics in Table 14. Harvest statistics for 1983 compared to 1982 and the 20-year (1963-82) average follow:

	<u>1983</u>	Percent change from	
		<u>1982</u>	<u>Average</u>
Forest grouse hunters	13,414	+8	-11
Forest grouse harvested	30,088	+38	-16
Hunter-days afield	34,530	+20	-2
Forest grouse per hunter-day	0.87	+14	-14
Forest grouse per hunter	2.24	+27	-1
Percent ruffed grouse	37.8	+10	-3
Percent blue grouse	56.4	+1	+4
Percent unidentified	5.9	-40	-14

Results from the harvest questionnaire indicated significantly higher forest grouse population levels than implied by summer surveys. Total harvest continued to drop from the record harvest of 1978. Hunter success (grouse per hunter-day) was 14 percent below average, although the number of grouse harvested per hunter was about average. Hunter pressure increased slightly but was still 11 percent below the 20-year average.

Field Bag Checks

A summary of field bag check data for 1983 is found in Table 15. Hunter success trends determined via this method are shown in Table 16. Results of the 1983 survey compared to 1982 and the 10-year (1973-82) average follow:

	<u>1983</u>	Percent change from	
		<u>1982</u>	<u>Average</u>
Total hunters checked	851	+21	-54
Total hours hunted	3,190	+11	-56
Forest grouse per hunter (complete hunts)	0.55	+12	0
Forest grouse bagged per 100 hours	14	+17	-13
Average hours per hunter-day (complete hunts)	4.01	-4	-2
Hours hunted per grouse bagged (complete hunts)	7.3	-14	-12

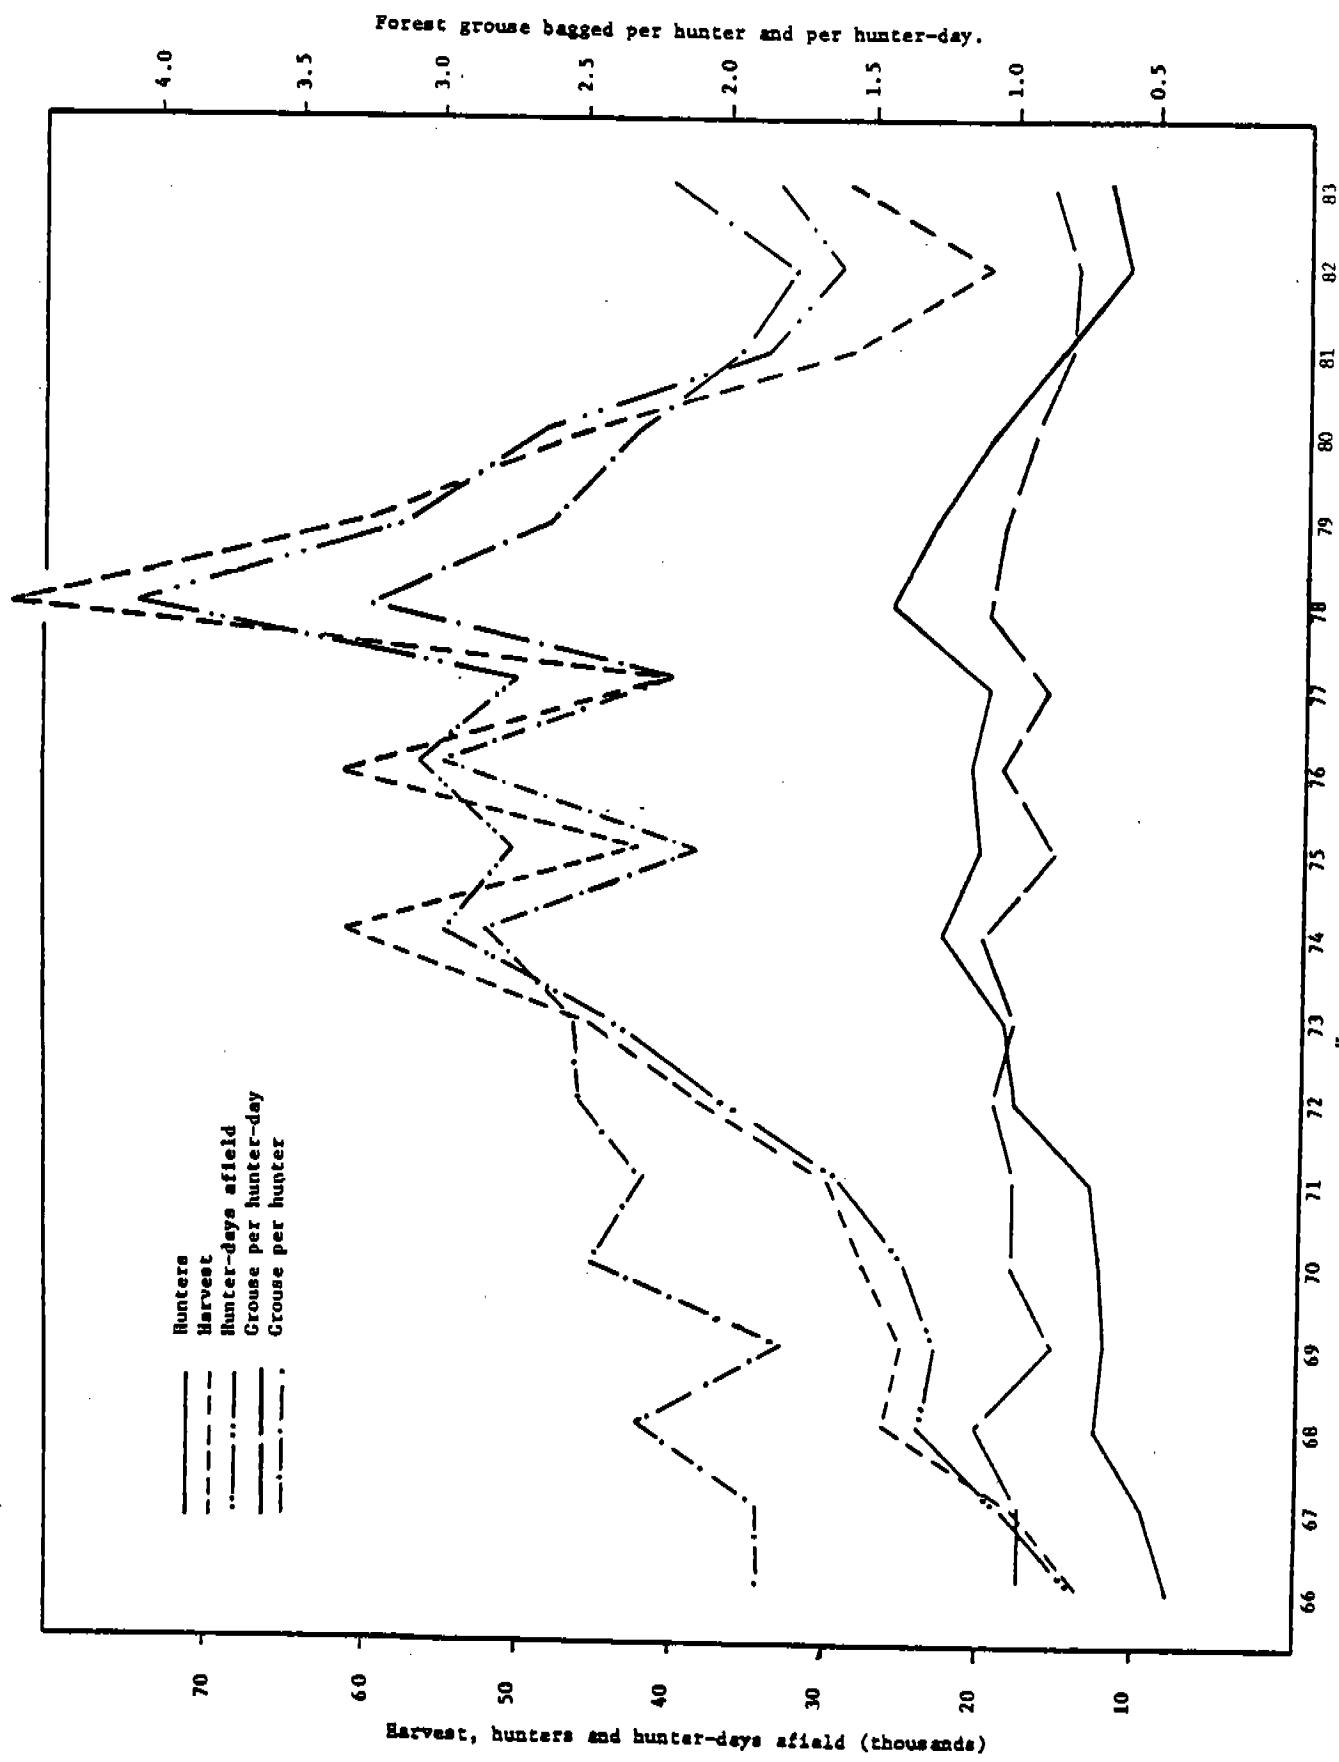

Figure 1. Statewide trends of forest grouse harvest statistics.

²Combined data from Cache, Rich and Weber counties considered as one population of blue grouse.

QUAIL

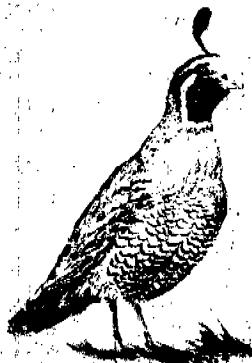

SUMMARY

The 1983 breeding populations of California and Gambel's quail were considerably less than 1982 and average.

However, production of both California and Gambel's quail increased from 1982 to well above average. Nevertheless, quail observation trends were still below average in most areas of the state.

Harvest statistics, when compared to 1982, showed a decrease in total hunters but total harvest increased. Hunter success (birds per hunter-day) remained below average statewide. An increase in hunter days afield and total harvest of Gambel's quail was reported in Washington County.

Brood Counts

Results of the annual random brood counts for 1983 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4. Survey results for 1983 compared to 1982 and the previous 10-year average follow:

	<u>1983</u>	<u>Percent change from 1982</u>		<u>Average</u>
Total quail observed	430	+3	-38	
Young per 100 adults	412	+207	+82	
Mean brood size	9.71	+60	+42	
Quail observed per 100 hours	411	+1	-29	
Total hours effort	104.5	+2	-15	

Harvest statistics for 1982 indicated a poor breeding population of quail statewide; however, breeding populations of California quail increased in the Northern, Northeastern and Southeastern regions. Gambel's quail in Washington County showed a slight decrease in breeding population.

Gambel's quail call counts on the west slope of Beaver Dam Mountains were discontinued in 1980.

Brood counts indicated excellent production of both California and Gambel's quail. Production increased significantly from 1982 and was well above average.

Harvest

Results of the annual hunter questionnaire for 1983 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8, and total statewide harvest statistics in Table 9.

Comparison of the 1983 season to 1982 and the previous 24-year average follow:

	<u>1983</u>	<u>Percent change from 1982</u>		<u>Average</u>
Quail hunters	4,012	-8	-41	
Quail harvested	11,248	+14	-41	
Hunter-days afield	10,232	-3	-39	
Quail per hunter-day	1.10	+18	-4	
Quail per hunter	2.81	+24	-1	

Harvest for 1983 increased 14 percent from 1982 but was still 41 percent below average.

Hunter success and total harvest for Washington County (Gambel's quail) increased 29 percent and 34 percent, respectively from 1982. Hunter-days afield also increased 4 percent. Only 24 percent of the statewide harvest of quail was taken in Washington County during 1982 compared to 21 percent in 1982 and nearly 41 percent in 1981.

Long-term quail harvest statistics are shown in Figure 1.

HUNGARIAN PARTRIDGE

SUMMARY

Harvest data for 1982 indicated that 1983 breeding population densities were less than 1982. Very limited brood data indicated below average Hun densities for 1983.

The 1983 hunt indicated increased hunting pressure on Huns when compared to 1982. The number of hunters afield and Huns harvested increased in 1983. The hunter-days afield increased 30 percent. Total hunters, days afield and harvest remained below the long-term average. Hunter success, however, was slightly higher than the long-term average.

U
N
S

Brood Counts

Results of the annual random brood counts for 1983 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of the survey for 1983 compared to 1982 and the previous 10-year average follow:

	<u>1983</u>	<u>Percent change from 1982</u>	<u>Average</u>
Total Huns observed	40	-29	-73
Young per 100 adults	400	-2	-29
Mean brood size	10.67	-5	+1
Huns observed per 100 hours	67	-53	-67
Total hours effort	60	+54	-35

Harvest data for 1982 indicated a below average breeding population for 1983.

The hours of effort increased 54 percent from 1982, but still remained 35 percent below average. The number of Huns observed decreased 29 percent. Only three broods were observed in 1983, so that any trends based on this small sample is fairly unreliable. Mean brood size remained slightly above average.

Harvest

Hunter Questionnaire

Results of the annual hunter questionnaire for 1983 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1983 season compared to 1982 and the previous 24-year average follow:

	<u>1983</u>	<u>Percent change from 1982</u>	<u>Average</u>
Hungarian partridge hunters	2,889	+12	-29
Hungarian partridge harvest	6,506	+45	-27
Hunter-days afield	6,998	+30	-31
Huns per hunter-day	0.93	+12	+6
Huns per hunter	2.25	+30	+2

Hungarian partridge hunting pressure increased slightly, while success also increased during 1983 as compared to 1982. Nevertheless, harvest was 27 percent below the long-term average.

Field Bag Checks

Results of the survey for 1983 are shown in Table 10. Hunter success trends determined via this method are shown in Table 11. Indices obtained for 1983 compared to 1982 and the previous 10-year average follow:

		<u>Percent change from</u>	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Total hunters checked	8	-56	-83
Total hours hunted	30	-59	-85
Huns per hunter (complete hunts)	0.62	-53	-16
Huns bagged per 100 hours	17	-47	0
Average hours per hunter-day (complete hunts)	3.8	-7	-5
Hours hunted per Hun bagged (complete hunts)	6.0	+94	-26

WILD TURKEY

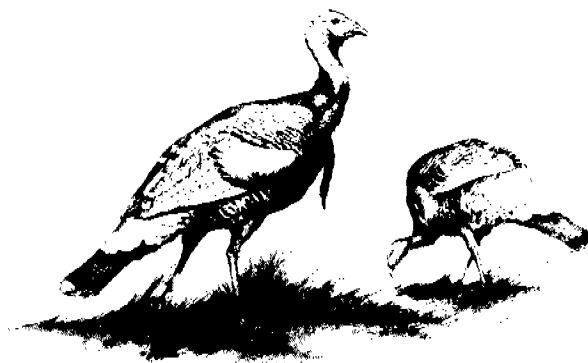

SUMMARY

Turkey populations remain very low, with the exception of the East Zion unit, where the turkeys appear to be slowly increasing in numbers. Previous year's droughts and severe winters are believed to be the major factors in the general decline of wild turkeys.

Hunter success and turkey observation data for the 1983 spring and fall seasons indicated that the East Zion area had another year of stable or increasing turkey population. However, the remaining units of the state were either closed to hunting or have declining populations of turkeys.

Spring hunting pressure was down from 1982 but hunter success was up 31 percent. Similarly, fall hunting pressure was down 2 percent and hunter success was up 22 percent. A total of 29 turkeys were harvested in 1983 compared to 23 taken in 1982. Observations of turkey increased in 1983, with most observations made on the East Zion area.

Precipitation in south-central Utah was slightly above normal from May through August, while temperatures were slightly below normal, which was similar to 1982. The effect on production has not been determined because of limited data.

Brood Counts

Annual random brood counts have been conducted each year since the introduction of turkeys into Utah in the early 1950's; however, success in finding broods has usually been poor. Sample sizes have generally been too low to meaningfully indicate relative density or production from year to year. Spring harvest data for 1983 indicated an improved breeding population on the East Zion unit. Harvest increased slightly from 1982. Fair reproductive success was also evident from the 1982 fall harvest statistics. No turkey brood observations were reported in 1983.

Harvest

Spring Gobbler Season

Results of the 1983 spring season are shown in Table 1 of this section. The trend of these data since the first season in 1967 is shown in Table 2. The 1983 spring season compared to 1982 and the previous 16-year average follow:

	<u>1983</u>	Percent change from	
		<u>1982</u>	<u>Average</u>
Permits sold	92	+1	-36
Hunters afield	69	-14	-48
Turkeys harvested	14	+17	+17
Hunter-days afield	161	-13	-51
Percent hunter success	21	+31	+133
Turkeys bagged per hunter-day	0.09	+29	+125
Percent of hunters who observed turkeys	55	-11	+62

Permit sales and hunters afield increased from 1982 but still remained below average. The total harvest has increased from 12 in 1982 to 14 in 1983, 17 percent above the 16 year average. The proportion of hunters who reported having observed turkeys decreased 11 percent below the 1982 level but still 62 percent above average. The East Zion unit again accounted for 75 percent of the hunting pressure based on hunter-days afield.

Approximately 26 percent of the turkey hunters used rifles during the spring turkey season, and 42 percent of the turkeys harvested were taken with a rifle.

The trend of spring turkey harvest statistics is shown in Figure 1.

Fall Season

Results of the 1983 fall season are shown in Table 3 of this section. The trend of these data since 1970 are shown in Tables 4-9. The 1983 fall season compared to 1982 and the previous 19-year average follow:

	<u>1983</u>	<u>Percent change from 1982</u>	<u>Average</u>
Permits sold	61	+9	-56
Hunters afield	49	-2	-61
Turkeys harvested	15	+36	-59
Hunter-days afield	112	-18	-61
Percent hunter success	28	+22	+27
Turkeys bagged per hunter-day	0.13	+63	0
Percent of hunters who observed turkeys	49	+4	+40

Approximately 14 percent of the turkey hunters used rifles during the fall hunt and 27 percent of the turkeys killed during the fall hunt were killed by rifle. A few hunters hunted with bow and arrow and muzzle loading rifles, but shotguns were still the most popular weapon for turkey hunters.

The trend of fall harvest statistics is shown in Figure 2.

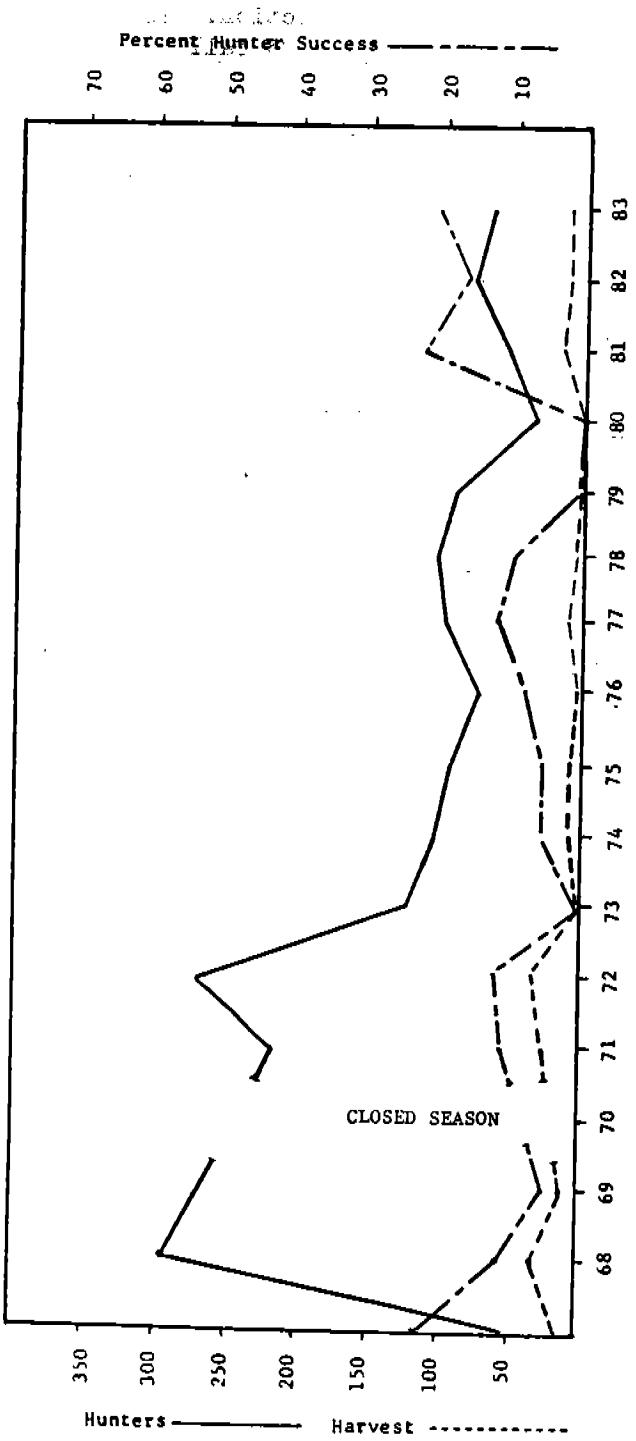

Figure 1. Wild turkey bobble harvest trends for spring seasons.

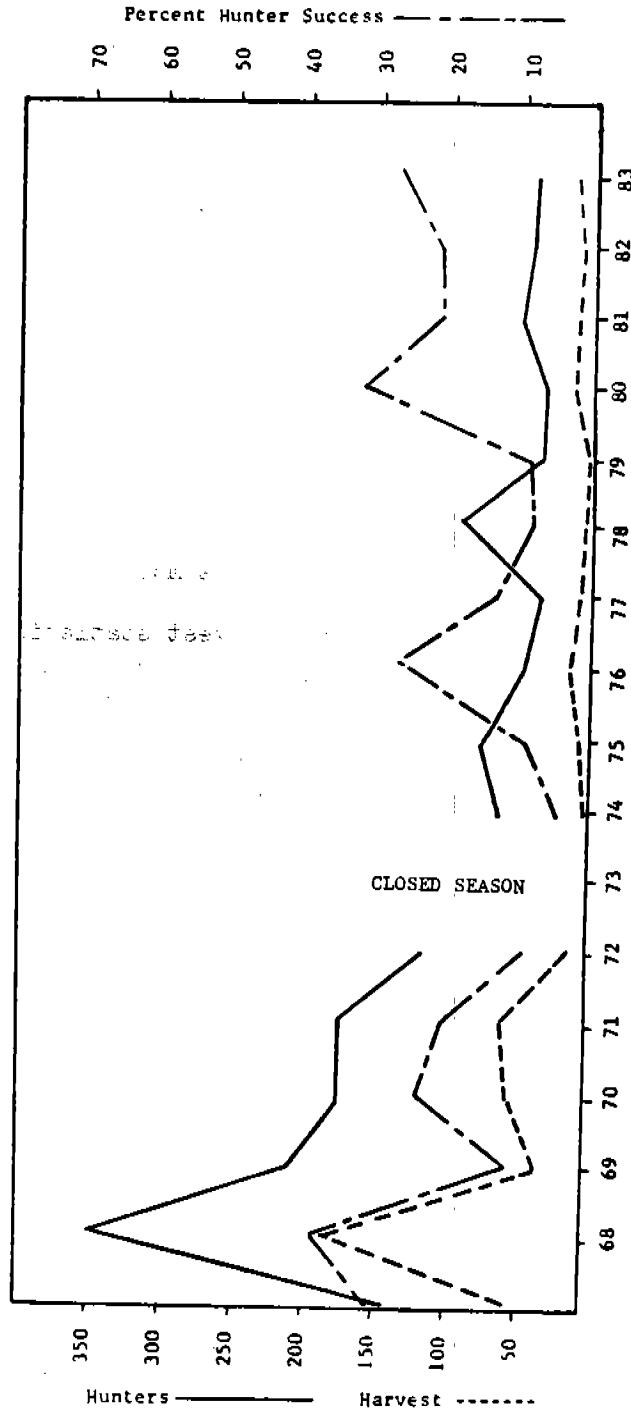

Figure 2. Wild turkey harvest trends for fall seasons.

TOTALS (1963-83)	2,704	2,452	5,293	718	(438)	0.14	(296)	8,704	(715)
AVERAGES (1963-82)	139	126	288	37	22	0.13	16	467	35

*Some hunters hunted more than one area or failed to designate areas hunted. This accounts for the difference between totals given above and combined tables of separate units in Tables 5, 6 and 7.

**During 1968, the Boulder Mountain and East Zion units had two-bird season limits and the LaSal Mountains a one-bird limit; from 1969 through 1972, all areas had a two-bird limit. Hunter success was based on the number of successful hunters rather than total turkeys bagged.

***Closed Season.

SHARP-TAILED GROUSE

SUMMARY

The Columbian sharp-tailed grouse is one of four species of grouse native to Utah. Sharptails were formerly abundant in the valley and foothill areas of northern and central Utah. Sharp-tailed grouse habitats were the most attractive areas for agricultural development and grazing. As a result, 'sharp-tail' habitat was directly converted to farmland or was seriously impacted by heavy grazing.

Because of habitat loss, sharptails have been extirpated from most of their former range and are now found only in extreme northern Utah, including Box Elder, Cache, Morgan and Weber counties.

In Utah, sharp-tailed grouse were completely protected from hunting from 1925-1973. Beginning in the early 1970's, field reports from various individuals and observations by Division personnel indicated that sharptails were becoming more numerous in several areas. It was felt, at this time, that limited hunting was justified. Limited hunting was legalized in 1974 and continued through 1979. However, due to a decline in observations during the 1980 spring and summer inventory period, the entire state was closed to hunting sharptails, and remained closed through 1983.

The Division has done fairly extensive fieldwork on sharptails since 1975. This work has centered on locating populations and the associated dancing grounds, evaluating habitat use, examining seasonal migration patterns and monitoring population trends.

Current management of sharptails includes counting of known dancing grounds, searches for new dancing grounds, brood counts and collection of harvest information.

Beginning in 1979, all sharptail hunters were required to obtain a free "Sharp-tailed Grouse Hunting Permit." Questionnaires were sent to all permittees following the season and results were obtained. Harvest figures are not available for the years 1974-1978, but field observations indicate that hunting pressure and harvest were fairly constant during that period and comparable to 1979.

There was no legal harvest of sharp-tailed grouse from 1980 through 1983. Populations have remained down since 1978. Severe winters the last two years have severely reduced sharp-tailed grouse numbers in northern Utah.

WHITE-TAILED PTARMIGAN

SUMMARY

The white-tailed ptarmigan (Lagopus leucurus) was introduced into the Uinta Mountains of northern Utah in 1976 with the release of birds captured in Colorado. The initial transplant consisted of 22 paired birds released in June 1976. A second release of 35 mixed young and adults was accomplished in September of that same year.

This successful transplant was the result of a cooperative effort of the Utah Division of Wildlife Resources, the Ashley and Wasatch National Forests of the U. S. Forest Service, and the Colorado Division of Wildlife.

The original two releases of white-tailed ptarmigan were made at a point about one-half mile southeast of Gunsight Pass and one mile east of Kings Peak in Painter Basin of the Uinta River drainage. Subsequent studies have shown that the population in Painter Basin has increased to the point that birds may be at carrying capacity. Breeding territory surveys in 1977 indicated reproduction from transplanted birds and the transplanted birds themselves had survived their first year. Presently, birds are known to exist in Henry's Fork, Yellowstone Basin, Gilbert Basin, Atwood Basin, Beaver Basin, Lake Blanchard, Smith's Fork, and Rainbow Basin. Evidence for existence of birds has been found in Rock Creek, Black's Fork, Garfield Basin, and Lake Fork. Presently, ptarmigan are believed to be distributed from Holiday Park (Weber River drainage) on the west to Greendale (Flaming Gorge) on the east. Both sightings were made in winter at unusually low elevations (7,800 ft. & 7,000 ft.).

Surveys on the ptarmigan population will continue with emphasis on documenting habitat expansion. Areas of emphasis will include Samuels Lake in the Uinta River drainage to Deadman Lake in the Dry Fork drainage. Two survey techniques will be used. A breeding territory survey will be conducted from mid- to late June. The brood survey will be conducted from mid- to late August. The technique consists of returning to areas where birds were located in the June survey and searching intensively in likely brood habitat with trained hunting dogs. Chicks will be captured, weighed, banded, and primary molt will determine approximate hatching date. Results of the last 6 years of survey data are located in Tables 1 and 2.

The ptarmigan population has now been subjected to a wide range of weather extremes. The winter of 1976-77 was extremely dry, cold and snowfree, whereas the 1978-79 winter had above average snowfall and a late spring thaw. This was followed (1979-80) by a near record late snow pack and extraordinarily dry summer. Accumulated snowfall was considerably less than normal during the winter of 1980-81 with abundant breeding territories available during the June survey. The winter snowpack of 1981-82 was extremely heavy and the 1982-83 snowpack was above average. This past 1983-84 snowpack appears below average.

The 1983 spring survey was cancelled because of excessive snow conditions. Snowpack remained until July, with heavy winter snow and accumulation continuing into late May. (Grandison-unpublished 1983 Annual Report).

The 1983 breeding season was worse than 1982. As in 1982, reproductive success was extremely poor due to record late snowpack on breeding areas. Again, indications were that survival of adults remained good. (Table 2).

Hunter Success

Thirty-one hunters obtained permits to hunt ptarmigan in Utah for the second season. An estimated 18 actually hunted with 13 birds reported killed. This was the first year ptarmigan were taken by Utah sportsmen. Thirty percent of the hunters afield saw ptarmigan and killed birds. Hunter success or birds bagged per hunter-day was as high (0.67) as other upland game.

Table 1. Summary of white-tailed ptarmigan breeding territories (pairs), 1977-83.

County	Location	(6/20-23) 1977	(6/12-19) 1978	(6/18-24) 1979	(6/12-17) 1980	(6/12-14) 1981	(6/16-17) 1982	(6/16-17) 1983

Summit	Beaver Creek				0			
Summit	Smith's Fork				1			
Duchesne	Yellowstone River				2			
Uintah	Leidy Peak				0 ³			

¹Three territorial males were yearling birds, the result of successful reproduction by released birds in 1976. Two were spring-released birds and two were fall-released.

²An additional 4 males and 1 female were located. Birds from the June 1976 transplant are well represented in the population while only two September released birds have been located. Recruitment from the 1976 and 1977 nesting seasons was evident in the 1978 population.

³A sighting of ptarmigan was reported by a hunter in October 1979. Division Biologists reported droppings at the base of Leidy in the willow on June 25, 1981.

⁴Excessive snow cover precluded access to trail-heads during the June breeding period.

RABBITS AND HARES

SUMMARY

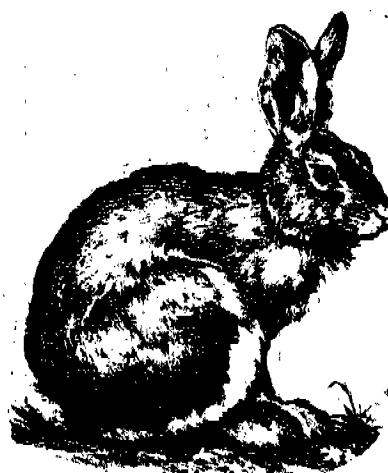

Cottontail Rabbits

A slightly below average but improved breeding population level for 1983 was indicated by the 1982 harvest statistics.

Summer roadside counts also indicated a decreased population density, although the northern and central regions showed a slight increase. Harvest statistics indicated 70 percent of the harvest was from the Northeastern and Southeastern regions, with a total harvest of 180,767 cottontails by 22,467 hunters afield.

Snowshoe Hares

The 1983 snowshoe hare hunting season was the ninth held since the Legislature provided protected status to this species in 1975.

Harvest statistics for 1983 indicated decreased hunter participation and hunter success. This decrease may reflect an actual trend or it could be the result of improving identification of whitetailed jackrabbits. Although efforts have been made to educate hunters in the identification of the snowshoe hare and the whitetailed jackrabbit, it is still a potential problem which could bias the snowshoe data.

COTTONTAIL RABBIT

Roadside Counts

Results of the annual roadside counts for 1983 are shown in Table 1 of this section. The trend of cottontails observed per mile and young per 100 adults since 1973 is shown in Tables 2 and 3, respectively. Indices for 1983 compared to 1982 and the 10-year average follow:

	<u>1983</u>	<u>Percent change from 1982</u>	<u>Average</u>
Total miles driven	1,932	-8	-22
Total cottontails counted	787	-29	-14
Cottontails observed per mile	41	-23	+17
Young observed per 100 adults	72	-8	-33

An increased, but yet, below average breeding population for 1983 was indicated by 1982 harvest statistics. Indicated production, likewise, was 8 percent below 1982 and 37 percent below the average.

The cottontail per mile index was down in all regions except the Northern and Central but was 17 percent above the average.

Harvest

Hunter Questionnaire

Results of the 1983 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county since 1977 are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figure 2. Results of the 1983 season compared to 1982 and the 16-year average follow:

	<u>1983</u>	<u>Percent change from 1982</u>	<u>Average</u>
Cottontail hunters	22,467	-16	-18
Cottontail harvest	180,767	+15	-5
Hunter-days afield	96,151	-9	-16
Cottontails per hunter-day	1.88	+27	+21
Cottontails per hunter	8.05	+37	+25

Total harvest, increased from 1982, however, there was a decrease in hunters and hunter-days afield. Total harvest however, remains (5 percent) below average. Success increased 21 percent above average, indicating an increased population of cottontails.

Field Bag Checks

Results of the survey for 1983 are shown in Table 9. Trends of hunter success as determined by bag checks are shown in Table 10. Following is a comparison of the 1983 field bag check data to 1982 and the average.

		Percent change from	
	<u>1983</u>	<u>1982</u>	<u>Average</u>
Total hunters checked	136	-13	-65
Total hours hunted	344	+14	-68
Cottontails per hunter (complete hunts)	3.07	+54	+62
Cottontails bagged per 100 hours	119	+47	+109
Hours per hunter-day (complete hunts)	2.0	-13	-40
Hours per cottontail bagged	0.9	-25	-55

Field bag check data was limited to the Northern, Northeastern and Southeastern regions. Data from other regions was not obtained.

*Cottontails per hunter based on all hunts.

SNOWSHOE HARE

Harvest

The ninth annual snowshoe hare hunting season was held statewide in 1983. Results of the 1983 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. The 1983 season compared to the season in 1982 and the average of the first eight hunts follow:

		Percent change from	
	1983	1982	Average
Snowshoe hare hunters	3,544	-17	-44
Snowshoe hares harvested	6,302	-32	-59
Hunter-days afield	11,088	-15	-42
Snowshoes per hunter-day	0.57	-20	-26
Snowshoes per hunter	1.78	-18	-24

Significant misidentification of whitetail jackrabbits as snowshoe hares was anticipated prior to mailing the harvest questionnaire following the first season in 1975. This proved to be the case as a significant harvest of snowshoe hares was reported for counties outside the known range of the species. It was assumed that the problem was statewide, not just confined to those counties.

The 1976 harvest questionnaire was modified in an attempt to better inform respondents concerning the potential for misidentification and aid them in distinguishing between these two varying hares. Comparative reported harvests between 1975 and 1976 suggest that this was accomplished, at least to a significant degree, but the relatively large harvest in counties outside of the snowshoe's range suggested continued confusion. Further refinement was made in the 1977 harvest questionnaire in an effort to more clearly define the snowshoe hare harvest.

In 1978, a leaflet containing pictures and descriptions of the different species of hares found in Utah was mailed with the questionnaire. As a result of the identification leaflet, it is assumed that the data have been more accurate.

Results of the 1983 questionnaire indicate a 19 percent increase in snowshoe hare hunters and comparable harvest to 1981.

It is unknown what proportion of the reported snowshoe harvest is actually whitetail jackrabbits incorrectly identified by the hunters. However, it is believed that identification has been improving as a result of efforts to educate the hunter on the differences between the various species of hares found in Utah.

Hopefully, the 1983 increase in hunters afield and harvest does not reflect inaccurate identification of the snowshoe, but rather an actual increase in hunter participation and harvest.

Snowshoe hare	8,205	6,787	4,048	3,554	4,245	3,544	7.8	6.5	4.0	3.7	4.3	3.9
TOTAL HUNTERS***	105,288	104,834	100,164	96,196	97,705	90,592						

*Includes both spring and fall hunts.

**Although wild turkey, band-tailed pigeon, ptarmigan and sharp-tailed grouse harvest was determined by separate questionnaires, it is assumed that these hunters are derived from the same group of hunters who reported hunting other upland game bird species.

***Note: the columns do not total. This is due to the fact that many upland game hunters hunted more than one species.

Table 4. Percent of hunter trips resulting in failure to bag at least one bird, 1961-83.

Table 6. Season framework for upland game during 1983.

Species	Season Dates	Daily Bag Limit	Possession Limit	Area Open
Pheasant	Nov. 5-13	2 cocks	4 cocks	Statewide
	Nov. 5-18	2 cocks	4 cocks	Box Elder, Cache, Davis and Weber counties.
	Nov. 5-20	2 cocks	4 cocks	Duchesne and Uintah counties.
	Nov. 5-Dec. 4	2 cocks	4 cocks	All state and federal lands (subject to restrictions and closures imposed by administering agencies) in Carbon, Duchesne, Emery, Grand, Juab, San Juan, Sanpete, Tooele, and Uintah counties; and that portion of Wayne County east of Capitol Reef National Park; and Bear River National Wildlife Refuge.
Mourning dove	Sept. 1-30	15	30	Statewide.
Band-tailed pigeon	Sept. 1-30	5	10	Beaver, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sevier, Washington and Wayne counties.
Chukar	Sept. 17, 1983-Jan. 31, 1984	5	10	Statewide except as noted below.
	Sept. 17-Nov. 30	5	10	Cache, Morgan, Rich, Sanpete, Summit, Wasatch and Weber counties, Davis County except Antelope Island and those portions of the following counties lying east of Interstate 15: Box Elder, Juab, Salt Lake and Utah counties.

Daggett, Duchesne and Uintah counties were closed to chukar hunting during 1983.

Table 6 (continued)

Species	Season Dates	Daily Bag Possession		Area Open
		Limit	Limit	
Sage grouse	Sept. 17-25	3	6	Beaver, Garfield, Iron, Kane, Piute, Sevier, and Wayne counties.
	Sept. 17-23	2	4	Box Elder (part), Daggett, Duchesne (part), Grand (part), Uintah, and Wasatch (part).
	Sept. 17-23	1	2	Box Elder (part), Cache, Morgan, Rich, Summit, Wasatch (part) and Weber counties.

The following counties were closed to sage grouse hunting during 1983:

				Carbon, Davis, Emery, Grand (part), Juab, Millard, Salt Lake, San Juan, Sanpete, Tooele, Utah, Wasatch (part), and Washington.
Forest grouse	Sept. 17- Nov. 30	4 (aggregate)	8 (aggregate)	Statewide.
Quail	Nov. 5-13	5	10	Statewide except Duchesne, Morgan, Summit, Uintah and Washington counties.
	Nov. 5-20	5	10	Duchesne and Uintah counties.
	Nov. 5-Dec. 31	8	16	Washington County.

Morgan and Summit counties were closed to quail hunting in 1983.

Hungarian partridge	Sept. 17, 1983- Jan. 31, 1984	5	10	Part of Box Elder County.
	Sept. 17-Nov. 30	5	10	Cache, Davis, Juab, Morgan, Rich, Summit, Tooele and Weber counties. Parts of Box Elder and Salt Lake counties.

Table 6 (continued)

Species	Season Dates	Daily Bag Limit	Possession Limit	Area Open
Wild turkey				
Spring hunt	Apr. 30-May 15		Season limit 1 male turkey	Garfield, Grand, Iron, Kane, Washington, Wayne and San Juan (part) counties.
Fall hunt	Sept. 17-Oct. 2		Season limit 1 turkey of either sex	Iron, Kane, Wayne, Washington and Garfield (part) counties.
Ptarmigan	Sept. 10-Oct. 18		Season limit 4 ptarmigan	Summit (part) and Duchesne (part) counties.
Snowshoe hare	Sept. 17, 1983-Jan. 31, 1984	5	10	Statewide.
Cottontail rabbit	Sept. 17, 1983-Jan. 31, 1984	10	20	Statewide except Box Elder (part), Cache, Davis, Morgan, Rich, Summit and Weber counties.
	Sept. 17, 1983-Jan. 31, 1984	5	10	Box Elder (part), Cache, Davis, Morgan, Rich, Summit and Weber counties.

Table 7. Summary of Upland game harvest questionnaire returns - 1962-83

Year	Questionnaires Mailed	Total Returns	Percent	Useable Returns	Percent	Percent of Licensees who did not hunt
1962	10,068	4,122	41.0	3,433	34.0	22.0
